

# Software Engineering Intern Assignment

Build an ESPN/MLB like game feed using MLB Data. Feel free to use those sites as inspiration for your solution!

A few pieces of additional info:

- <https://github.com/jldbc/pybaseball> provides access to MLB data or you can access the MLB stats API (<https://statsapi.mlb.com/api/v1/teams>). Docs are restricted, but there are many public wrappers that provide more information on the API such as <https://github.com/toddrob99/MLB-StatsAPI/wiki>
- Build as a responsive SPA application, should look intentionally designed for both mobile and desktop form factors
- Build the application using a modern JS Framework (Vue, React, Angular, Next JS) in Typescript. (Our tech stack is Vue)
